Thank you, Jon. I appreciate that. I assume that I have your permission to share this response with the CEWG members.

Thank you so much for your time.

Hi Jessica,

I read the report, which describes a very straight-forward and well executed effort to determine if there was an excess of ALS. The answer is clear, given the limitation of small numbers—no excess. I don't have any points of criticism. This sort of investigation is inherently limited by small numbers of cases of an uncommon disease with a largely unknown etiology. The investigators did the best job possible it appears.

Jon
